# BOXXER GOLD CORP.

Mar. 2, 2007

Boxxer Gold Corp. is a junior Canadian mineral exploration company focused on the exploration of projects with demonstrated exploration models for the discovery of large copper/gold deposits.

Boxxer is strengthened by two fundamental elements of Boxxer are: (I) quality projects and (II) experienced Management who is committed to establishing a distinctive profile for Boxxer in the North American mining industry.

The Company has four projects which include: Boss Property (copper/gold); Buena Vista (IOCG) and Boyer Ranch Copper Project (IOCG) all located in Nevada and The Gordon Lake (gold) in the North West Territories.

**The Boss Property** is a 3,300 acre block controlled 100% by Boxxer, and is located 90 km west of Las Vegas, Nevada in an under-explored part of the old Goodsprings mining district. The property is near the interpreted intersection of the Sevier Thrust and the Walker Lane tectonic lineament. Previous exploration on the property supports the porphyry model potential of the property, where thirteen large zones of porphyry style Cu, Au, Pt, Pd, Ag, mineralization have been located

over a 4 km. strike length on the western side of the property. Average grades from 184 channel samples to date, from old underground workings and surface sampling are as follows: **1.35% Cu, 0.96 g/t Au, 0.18 g/t Pt, 0.47 g/t Pd, 8.63 g/t Ag.**

**The Buena Vista Property** is located approximately 120 km northeast of Reno, in west-central Nevada. The property covers over 3,100 acres. Boxxer can earn an 80% interest in the property by making exploration expenditures of US\$1,000,000 over a period of three years, and assuming the lease obligations and holding costs on the property. At 12,000 ft long by 2,300 ft wide alteration zone hosting 47 copper/gold showings is the main exploration target. Diamond drilling is in progress.

**The Boyer Ranch Copper Project** is located in the Table Mountain Mining District, Churchill County, Nevada, about 25 km from the Buena Vista project. Exploration on the Property dates back to 1861 when several wagon loads of rich copper sulphides and oxides were taken from the Property. Exploration consisting of shaft sinking and drifting was completed on an area of the Property referred to as Treasure Box Hill in 1910.

Copper occurrences and associated alteration identified on the property are hosted in the Jurassic volcanic section and considered to be iron-oxide-copper-gold (IOCG) style mineralization. Recent sampling by Boxxer indicates mineralized outcrop are scattered over an area of at least 700 ft by 300 ft on Treasure Box Hill. Sampling of representative materials yielded copper values ranging from 0.02% to 40.9%.

**The Gordon Lake Project** covers a total of 6,023 acres, situated approximately 110 km northeast of Yellowknife, NWT. The geology of the area is similar to that which hosts the Giant & Consolidated Yellowknife gold mines. Both of these mines were producing gold mines for over 50 years. In February 2005, a 520m drill program was completed which confirmed the 1988 drill result. The weighted average grades from diamond drilling (56 holes) and channel sampling (41 samples) completed on three of the eight zones of gold mineralization located within a N-E trending shear zone that has been traced over a distance of 3 km are as follows:

Zone	Activity	Number	Width (m)	Grade (Au g/t)
Union	channels	16	2.65	10.24
	drill holes	10	4.21	3.1
South	channels	5	1.76	5.28
	drill holes	19	2.75	15.6
Main	channels	17	2.12	33.11
	drill holes	27	1.47	9.15
Camp	channels	3	1.6	13.65
