

FOR IMMEDIATE RELEASE – June 2, 2009

**Boxxer Provides Sampling Results from Boss #9 Zone;  
Drilling Expected to Commence Shortly**

CALGARY, Alberta – Boxxer Gold Corp (TSXV – “BXX”) is pleased to announce additional channel sampling results from its 100% owned Boss copper-gold project located in the Goodsprings Mining District, Nevada. The approval from the Bureau of Land Management to commence diamond drilling on the Boss Extension is expected shortly. The sampling of the Boss copper-gold deposit and the Boss #9 zone outlined the following results:

- **0.49 g/t gold and 4.27g/t PGE over 3.90 metres,**
- **0.10% copper, 0.7g/t silver over 5.20 metres.**

Mr. Elmer Stewart, President and CEO of Boxxer stated, “The low concentrations of copper and high concentrations of gold and PGE at the end of Boss deposit is consistent with previous analytical results and shows that the mineralization extends to the northeast and southeast past the workings. The results from the Boss #9 zone are encouraging, despite relatively low concentrations of copper-gold-silver, this zone shows a strong bismuth-arsenic-cobalt-nickel-lead-zinc geochemical signature indicative of a copper-gold skarn mineralized system.”

**Boss Deposit (formerly referred to as the Boss Mine):**

These samples were taken to define the limits of the mineralization on the third level of the former Boss copper mine. Sample BM-56-09 is located at the end of a cross-cut and the mineralized interval extends beyond the end of the cross-cut to the southeast. The wall rock contains minor amounts of hematite and limonite and traces of oxide copper mineralization. The copper mineralization in this zone has a strong bismuth-arsenic-cobalt-nickel-lead-zinc geochemical signature. Analytical results are listed below:

Sample #	Interval (m)	copper (ppm)	gold (g/t)	PGE (g/t)	silver (g/t)
BM-56-09	3.90	284	0.495	4.27	1.00
BM-57-09	5.10	117	0.130	0.06	0.50
BM-58-09	5.10	130	0.049	0.09	0.30
BM-59-09	3.35	761	0.166	0.08	1.10
BM-60-09	3.26	286	0.113	0.09	1.20

**PGE is the sum of platinum and palladium in a ratio of 1 to 3**

**Boss #9 Zone:**

These samples were taken from an adit and outcrop around the adit. Oxide copper mineralization and hematite is exposed in outcrop (skarn) over an area that measures 45 m high by 50 m wide around the adit as disseminations, veinlets and small replacement pods. The copper mineralization in this zone has a strong bismuth-arsenic-cobalt-nickel-lead-zinc geochemical signature. Analytical results are listed below:

Sample #	Interval (m)	copper (ppm)	gold (g/t)	silver (g/t)
B9-01-09	5.20	1020	0.02	0.70
B9-02-09	2.40	374	0.01	0.50
B9-03-09	1.52	199	0.01	0.80
B9-04-09	4.51	457	0.01	0.60
B9-05-09	3.23	1060	0.01	0.80

The Boss #9 zone is located at significantly higher altitudes (approximately 200 m) than the other zones of copper-gold mineralization located to date on the Boss project. The different metal concentrations in the Boss #9 zone could be due to either a separate mineralizing event or the lateral and vertical zonation of the metals that is observed in numerous other skarn/porphyry mineral districts.

**Future Plans:**

Diamond drilling on the Boss Extension, complete sampling of the Copperville mine, the Boss #10 Zone and Ironside Northeast zone, and detailed prospecting and mapping of the large copper-gold bedrock anomalies.

**Sample Preparation and Analysis:**

All channel samples were collected with a hammer and chisel and represent continuous sampling of the material within the sample interval. Sample weights ranged from 3.7 to 8.7 kilograms and sample intervals ranged from 1.5 to 5.1 metres. All samples were prepared ALS Chemex laboratory in Winnemucca, Nevada, and were analyzed by ALS Chemex in Vancouver, British Columbia, using PGM-ICP 23 for gold, platinum and palladium and ME-ICP41 for silver and copper and other metals. ALS Chemex's quality system complies with the requirements for the International Standards ISO 9001:2000 and ISO 17025:1999. Analytical accuracy and precision are monitored by the use of international and in-house standards.

**Quality Control:**

Boxxer follows a rigorous Quality Assurance/Quality Control program consisting of inserting blanks and duplicates into the sample stream submitted to the laboratory for analysis.

Elmer B. Stewart, MSc. P. Geol., President of Boxxer, is the Corporation's nominated Qualified Person pursuant to National Instrument #43-101, Standards for Disclosure for Mineral Projects, has reviewed the technical information disclosed in this news release.

**About Boxxer Gold Corp.**

Boxxer Gold is a Canadian junior resource company involved in the exploration of three copper-gold projects in the state of Nevada, and a shear hosted gold project located 110 kilometres north of Yellowknife NWT, Canada.
